# CLIMATE RISK TECHNICAL BULLETIN

---

## ABOUT THIS BULLETIN

The SASB Standards Climate Risk Technical Bulletin is intended to help investors and other providers of financial capital better understand their exposure to climate-related risks and opportunities. It also demonstrates for companies, regulators and policymakers how those exposures can be more effectively disclosed for integration into investment decisions.

---

## ABOUT THE SASB STANDARDS

SASB Standards enable organisations to provide industry-based disclosures about sustainability-related risks and opportunities that could reasonably be expected to affect the entity's cash flows, access to finance or cost of capital over the short, medium or long term. As of August 2022, the International Sustainability Standards Board (ISSB) of the IFRS Foundation assumed responsibility for the SASB Standards. The ISSB has committed to maintain, enhance and evolve the SASB Standards and encourages preparers and investors to continue to use the SASB Standards. To download any of the 77 industry-based standards, or learn more, please visit [sasb.org](https://sasb.org).

## INTRODUCTION

*The SASB Climate Risk Technical Bulletin is intended to help investors and other providers of financial capital better understand their exposure to climate-related risks and opportunities and also demonstrates for companies, regulators and policymakers how those exposures can be more effectively disclosed for integration into investment decisions.*

---

### OVERVIEW

Today, it is widely recognized that the world's economic systems exist within—rather than apart from—its natural systems. For example, companies, investors, and other market participants now take it for granted that natural resources provide critical inputs to businesses, power their processes, and are impacted by their outputs as they seek to create value for customers, for shareholders, and for other stakeholders. However, this view was not always commonly held and, as a result, existing approaches to financial accounting and financial reporting were never designed to capture these linkages between financial capital and other critical sources of value.

In today's world, for example, concerns about climate change have heightened, with scientific consensus—and, increasingly, lived experience—indicating substantial long-term threats to the financial stability of markets, the resilience of investment portfolios, and the viability of some business enterprise. At the same time, detailed analysis suggests that bold action to address climate change could potentially yield a global economic gain of US\$26 trillion through 2030.<sup>1</sup> Investors, as providers of the financial capital that is the lifeblood of global markets, have increasingly recognized the importance of measuring and managing their exposure to climate-related risks and opportunities.

As this bulletin demonstrates, these risks and opportunities are now undeniably present in nearly every industry. Because of this ubiquity, investors cannot diversify away from climate risk;

instead, they must focus on managing it—and encouraging portfolio companies to manage it—in all its forms.

Among these risks are the physical effects of climate change, such as those due to the increasing frequency and severity of weather-related events; liabilities related to a shifting regulatory landscape; and the challenge of navigating the transition to a resilient, low-carbon economy. Each of these risks can have a positive or negative impact on a company's financial condition, operating performance, or cost of capital—and therefore on an investment portfolio's risk-return profile.

This bulletin is intended to assist investors and companies in their efforts to more effectively manage and communicate about climate risk. First, for investors, it presents a comprehensive view of where climate risk is likely to be present across a diversified portfolio and maps that risk to corresponding financial impacts to provide a greater understanding of exposures and value at risk. Second, for companies, the bulletin shares recommendations on how industry-specific climate risk can be more effectively measured, managed, and disclosed, ensuring markets have the information they need to price climate-related risks and opportunities.

## SASB STANDARDS AND CLIMATE RISK

**Climate risk has financial implications that are tangible and identifiable.** The SASB Standards were designed to identify the sustainability issues reasonably likely to affect the prospects of the typical company in an industry. Each industry-specific disclosure topic, including those related to climate risk is mapped, to one or more channels of financial impact commonly evaluated by financial analysts—namely those that would affect a company’s revenues and operating costs, the value of its assets and liabilities, and its financing costs. (See example in Figure 1.) For instance, an energy-intensive firm might be exposed to volatile energy prices, and/or incur future costs from internalization of carbon prices, while investments in energy efficiency and renewable energy sources may require research and development (R&D) and capital expenditures.

This bulletin identifies the financial impact channels associated with each type of climate risk in each industry (see Table 2).

Using the information contained in this bulletin, investors can gain a deeper understanding of the types of climate risk to which they are exposed, where those exposures lie, where they are likely to be uncompensated, and what types of financial impacts they are likely to have. Using the disclosure recommendations, companies can more effectively describe how they are managing climate-related risks, the related impacts on their financial position, and the relevant implications for their long-term financial performance and enterprise value.

Figure 1. Example of SASB Financial Impact Channels

| Income Statement |             |               |                    |     |                        |                         | Balance Sheet   |                   |                                     |                             | Risk Profile    |                          |
|------------------|-------------|---------------|--------------------|-----|------------------------|-------------------------|-----------------|-------------------|-------------------------------------|-----------------------------|-----------------|--------------------------|
| Revenue          |             |               | Operating expenses |     | Non-operating expenses |                         | Assets          |                   | Liabilities                         |                             | Financing costs |                          |
| Market share     | New markets | Pricing power | Cost of revenue    | R&D | CapEx                  | Extra-ordinary expenses | Tangible assets | Intangible assets | Contingent liabilities & provisions | Pension & other liabilities | Cost of capital | Industry divestment risk |
| ■                | ■           | ■             |                    | ■   |                        |                         |                 |                   |                                     |                             |                 |                          |

## SASB CLIMATE RISK FRAMEWORK

Climate risk can affect investment risks and returns over the near, medium, and long term. Traditionally, many investors have evaluated the impacts of climate risk by assessing and reducing the “carbon footprint” of their portfolios (i.e., the Scope 1, Scope 2, and/or Scope 3 GHG emissions associated with each investment) or have considered divestment from fossil fuel companies or certain high-carbon industries, such as coal and tar sands. However, the ubiquity of climate risk and the wide range of differentiated impacts it has across a myriad of business operations suggest a wider range of information is needed to address climate risk exposure.

The approach in this bulletin links climate risk categories to corporate financial performance, and ultimately provides industry-specific disclosure topics and metrics that enable analysis of how these risks are being managed. The SASB climate risk framework, visualised in the following figure, addresses three distinct types of climate risk and three channels of financial impact through which climate risk can ultimately impact investment returns.

Figure 2. SASB Climate Risk Framework

The SASB climate risk framework enables:

- » Recognition that climate-related risks manifest in industry-specific ways.
- » Identification of key climate risks and opportunities and the specific financial impact channel through which they are likely to affect the value of the typical company in an industry over time.
- » Preparation of disclosures by companies that provide decision-useful information to investors in a cost-effective way.

### SASB CLIMATE RISK CATEGORIES

Below are detailed definitions of climate risk categories used by SASB. These categories are not mutually exclusive.

#### Physical effects

Climate change has a range of current and projected acute (punctuated, unpredictable) and chronic (progressive, predictable) effects on the physical environment. The probability, magnitude, and timing of these impacts are uncertain and will be influenced by geographic location, industry, and capacity for adaptation. Disclosures can help both companies and investors understand their exposure to the physical risks of climate change.

*Acute (event-related)*

Acute physical risks are associated with the impacts of more frequent and more severe catastrophic weather events (e.g., droughts, flooding, extensive wildfires, greater precipitation, higher wind speeds, etc.). Examples of such impacts may include physical damage to assets, supply chain disruptions, and/or electricity grid disruptions.

*Chronic (progressive)*

Chronic physical risks could be associated with sustained greenhouse gas emissions into the atmosphere, leading to the progressive impacts of increasing temperatures, changing precipitation patterns, and rising sea levels. Impacts may affect agricultural yields, shift growing seasons and species distribution, cause human disease migration, affect the availability and quality of water resources, and impact coastal residential and commercial real estate and infrastructure.

**Some examples of potential negative financial impacts from acute and/or chronic physical effects include:**

- » **Asset impairment** – long-lived physical asset and natural asset damage and impairment such as premature deterioration or devaluation of agricultural land, coastal real estate, infrastructure located in hurricane zones
- » **Cost increase** – short- and medium-term disruptions of operations, disruptions to transportation, supply chains, and distribution chains, increases in insurance premia, as well as long-term adaptation costs
- » **Loss of revenue** – work interruptions association with loss of grid power, flooding, or supply chain disruption, as well as productivity loss due to chronic temperature rise

The physical impacts of climate change may present opportunities to some companies. For example, some agricultural companies may experience increased agricultural yields in certain geographic regions, resulting in revenue growth.

**Transition to a low-carbon, resilient economy**

Transition risk refers to climate risk that manifests itself through shifts in market forces, - including new products and services that support mitigation or adaptation to climate change, as well as direct changes in consumer preferences. Such changes may be connected to GHG emissions intensity of operations and products (e.g., energy intensity of product manufacturing, fuel efficiency of vehicles, energy efficiency of home appliances, end-of-life emissions of products) or water consumption of operations or products (e.g., water intensity of food or beverage production, as well as for manufacturing

and power generation, lifecycle water consumption of home appliances, end-of-life contamination of freshwater sources).

The mitigation and adaptation to climate-related impacts may be influenced by the regulatory environment and the geographic location of a company, depending on what physical risks of climate change are present. Therefore, transition risk is often connected to either physical or regulatory risk—or to both. Such connections may exist in a company's direct operations or arise from downstream or upstream relationships in the value chain—e.g., regulatory pressures may prompt automakers to pursue a range of fuel-economy strategies, which can shift demand among auto parts manufacturers toward inputs that can enhance fuel efficiency, as well as among mining and chemicals companies for lithium to produce electric vehicle batteries.

Mitigation responses are those technologies and services that reduce a company's potential contributions to climate change, such as through increased energy efficiency, water efficiency, renewable energy uptake, and the capture or sequestration of carbon dioxide. Adaptation responses include, but are not limited to, infrastructure resiliency efforts and business model shifts (e.g., the introduction of new products and services, and aligning business models with new environmental conditions).

**Potential financial impacts from the transition to a low carbon economy include:**

- » **Revenue loss (due to demand contraction)** – reduced demand for fossil fuels as well as for products and services associated with the fossil fuel value chain
- » **Stranded assets** – devaluation or impairment of fossil fuel reserves
- » **Revenue growth** – growth in renewable energy, emergence of new industries and products, including carbon capture and sequestration, smart grid technologies, energy-efficient products, infrastructure adaptations, and green chemistry solutions
- » **Long-term cost reductions** – operating cost reduction from investments in updated infrastructure and technologies

Shifting consumer demand may put competitive pressure on companies. Thus, the failure to adapt and invest in R&D with the goal of reducing lifecycle impacts of products or services may hinder a company's long-term financial performance. At the same time, companies that can innovate and offer sustainable products and services could see increased revenue and build brand loyalty which could strengthen their pricing power.

## Regulatory risk

Regulatory risks may result from a range of legal and regulatory issues associated with climate change. This encompasses all international, national, and subnational targets, mandates, legislation, and regulations to address climate change. It also includes those that establish a price for carbon emissions and compliance with policy-driven responses to climate change such as those that mandate energy, water, and fuel efficiency, regulate greenhouse gas emissions, restrict or mandate specific electricity sources, and/or those that directly incentivise and subsidise certain services and technologies.

This category also encompasses a range of potential impacts that may occur due to legal actions against companies related to climate change. These include action against those deemed liable for the physical effects of climate change, including but not limited to deforestation and water withdrawal (also referred to as “liability risks”), allegations of breach of fiduciary duty by directors and officers, and disputes over the implementation of climate-related regulation.

Regulatory risk directly impacts companies that are subject to legal or regulatory actions, while indirectly it could impact regulatory and compliance costs across a company’s value chain.

### Potential financial impacts from climate regulation include:

- » **Operating costs** – explicit carbon pricing in certain markets and related increase of cost of grid electricity,

compliance costs, and/or fines related to climate regulation

- » **Revenue growth impacts** – Fossil fuel providers or large greenhouse gas emitters may be denied permits for new projects due to climate considerations. Meanwhile, climate-related incentives such as subsidies and tax credits might afford potential revenue growth for companies that qualify, such as wind and biofuel power producers in certain geographies.
- » **Legal expenses or liabilities** – if an entity is alleged to be liable for damages, adaptation, or other costs associated with the physical effects of climate change, failure to adequately disclose climate-related risks, or disputes over compliance with climate-related regulation.

A significant majority of countries around the world have enacted laws and policies to address climate change.<sup>2</sup> These include but are not restricted to limits on carbon emissions from power generators, funding for wind and solar generation, fuel-efficiency standards for vehicle manufacturers, and pricing programs for direct carbon emissions. These policies are all designed to ultimately reduce the amount of greenhouse gases entering the atmosphere by targeting parts of the energy value chain, resulting in a range of financial impacts and regulatory risks across industries.

<sup>2</sup> Grantham Research Institute on Climate Change and the Environment, “Policy brief: National laws and policies on climate change adaptation: a global review” (December 2019).

## SASB CLIMATE RISK MAP

Table 1 indicates the presence of these three primary types of climate risk (physical, transition, and regulatory risk) in each of the 77 SICs industries, as shown by the shaded boxes. Table 1 draws on relevant disclosure topics from the SASB Standards to present a holistic view of the climate-related risks and opportunities embedded in a typical diversified portfolio.

Table 1. SASB Climate Risk Map

| SECTOR  | INDUSTRIES                                       | CLIMATE RISK CATEGORY |            |            |
|---|--|-----------------------|------------|------------|
|   |  | PHYSICAL              | TRANSITION | REGULATORY |
|    | <b>CONSUMER GOODS</b>                            |                       |            |            |

## FINANCIAL IMPACT CHANNELS

Although the three types of climate risk identified in Table 1 are helpful in terms of thinking about how climate change affects different industries, business models, or specific companies, financial analysts also require an understanding of how those climate risks could impact companies in a financial sense, including current and future effects on a company's financial condition, operating performance, and its risk profile. The financial implications of climate risk can be grouped into three general categories: income statement impacts, balance sheet impacts, and risk profile impacts. As this publication uses the terms income statement and balance sheet to describe the financial impacts of climate change, it means both current and future impacts on the income statement, balance sheet, and cash flows—not only those that are currently recognised in the financial statements.

### Income statement

#### *Revenue impacts*

This category includes the impact on revenues and/or future cash inflows from climate-related effects on the company. These may be due to, for example, operational disruptions, changes in demand for products or services, changes in market share or product yield, reputational impacts, legal and regulatory factors, and/ or loss of social license to operate. Revenue may be affected positively or negatively depending on the company or industry.

#### *Operating cost impacts*

This category includes the impact on capital expenditures, operating expenses, and/or other cash outflows from climate-related risks. These may be due to changes in the costs of supplies, labor, investments needed to maintain or improve resource efficiency or adjust an entity's energy source mix, investments needed to comply with new regulations, legal expenses, and R&D expenses necessary to respond to competitive and market pressures. It may also include investments needed to repair facilities, improve infrastructure resiliency from exposure to increased storm events, and/or the cost of insurance from such exposure. Costs can be affected either positively (e.g., through increased resource efficiency) or negatively (e.g., CAPEX required to reduce emissions, increased cost of materials, higher insurance premiums, etc.).

### Balance sheet impacts

This category comprises effects on the value of assets due to regulatory actions such as carbon pricing, changes in asset value due to the physical effects of climate change, and/or other devaluation of assets due to the transition to a low-carbon, resilient economy. Current assets (e.g., inventory, crops, and livestock) and long-lived physical assets (e.g., coastal properties, infrastructure, and forestland) may be at risk for impairment or devaluation due to increased extreme weather events. Additionally, the amount of capitalised hydrocarbon reserves that are viable for extraction and production may be reduced due to carbon pricing in certain markets and shift in demand to renewable energy sources.

### Risk profile impacts

Climate change will have a range of effects on the viability of businesses, depending on their ability to effectively manage climate-related risks and opportunities. These scenarios will impact entities' ability to gain access to debt and equity capital, along with the cost of that capital. Entities that have greater exposure to the physical effects of climate change, fail to manage their transition risks, and insufficiently prepare for or adapt to climate regulations, will likely face debt and equity risk premia. Creditworthiness will erode and interest rates will rise as ratings agencies, investors, insurers, and lenders increasingly consider such climate risks. Certain industries may face "divestment" risks due to investor concerns over their contribution to GHG emissions, as well as due to reputational concerns. Entities better able to manage—and communicate their management of—climate risks and/or those that position themselves to benefit from a low-carbon economy could see higher credit ratings, lower debt financing costs, and lower cost of equity capital.

## SASB FINANCIAL IMPACT CHANNEL MAP

Table 2 illustrates the exposure of each of the 77 SICs industries to climate-related impacts through each financial impact channel (i.e., balance sheet, income statement, and risk profile). The potential financial impacts of specific climate-related topics are described at a more granular level in the SASB Standards, which can be found at [sasb.org/standards/download](https://sasb.org/standards/download).

Table 2. Financial impacts of climate risk

| SECTOR   | INDUSTRY   | INCOME STATEMENT | BALANCE SHEET | RISK PROFILE |
|--|--|------------------|---------------|--------------|
|  <b>CONSUMER GOODS</b>                        | Apparel, Accessories & Footwear                  |                  |               |              |
|  | Appliance Manufacturing                          |                  |               |              |
|  | Household & Personal Products                    |                  |               |              |
|  | Building Products & Furnishings                  |                  |               |              |
|  | E-Commerce                                       |                  |               |              |
|  | Multiline and Specialty Retailers & Distributors |                  |               |              |

# SASB CLIMATE METRICS TABLE

■ Physical Effects    
 ■ Transition to a Low-Carbon, Resilient Economy    
 ■ Regulatory Risk

Table 3. SASB Climate-related Disclosure Topics and Metrics by Industry

| INDUSTRY  | DISCLOSURE TOPIC   | METRIC  | METRIC CATEGORY                             | METRIC UNIT OF MEASURE                                  |   |
|---|--|---|---|---|---|
| <b>Apparel, Accessories &amp; Footwear Sustainability Accounting Standard</b> | Raw Materials Sourcing   | (1) List of priority raw materials; for each priority raw material: (2) environmental or social factor(s) most likely to threaten sourcing, (3) discussion on business risks or opportunities associated with environmental or social factors and (4) management strategy for addressing business risks and opportunities | Discussion and Analysis                     | n/a   | <span style="color: #0070C0;">■</span> <span style="color: #6B8E23;">■</span> |
|   |  | (1) Amount of priority raw materials purchased, by material, and (2) amount of each priority raw material that is certified to a third-party environmental or social standard, by standard  | Quantitative                                | Metric tonnes (t)                                       | <span style="color: #0070C0;">■</span> <span style="color: #6B8E23;">■</span> |
| <b>Appliance Manufacturing</b>  | Product Lifecycle Environmental Impacts  | Percentage of eligible products by revenue certified to an energy efficiency certification  | Quantitative                                | Percentage (%) by revenue                               | <span style="color: #6B8E23;">■</span>  |
|   |  | Percentage of eligible products by revenue certified to an environmental product lifecycle standard   | Quantitative                                | Percentage (%) by revenue                               | <span style="color: #6B8E23;">■</span>  |
|   |  | Description of efforts to manage products' end-of-life impacts  | Discussion and Analysis                     | n/a   | <span style="color: #6B8E23;">■</span>  |
| <b>Building Products &amp; Furnishings</b>                                    | Energy Management in Manufacturing   | (1) Total energy consumed, (2) percentage grid electricity and (3) percentage renewable   | Quantitative                                | Gigajoules (GJ), Percentage (%)                         | <span style="color: #0070C0;">■</span> <span style="color: #800000;">■</span> |
|   | Product Lifecycle Environmental Impacts  | Description of efforts to manage product lifecycle impacts and meet demand for sustainable products   | Discussion and Analysis                     | n/a   | <span style="color: #6B8E23;">■</span>  |
|   |  | (1) Weight of end-of-life material recovered, (2) percentage of recovered materials recycled  | Quantitative                                | Metric tonnes (t), Percentage (%) by weight             | <span style="color: #6B8E23;">■</span>  |
| Wood Supply Chain Management  | (1) Total weight of wood fibre materials purchased, (2) percentage from third-party certified forestlands, (3) percentage by standard and (4) percentage certified to other wood fibre standards, (5) percentage by standard | Quantitative  | Metric tonnes (t), Percentage (%) by weight | <span style="color: #6B8E23;">■</span>                  |   |
| <b>E-Commerce</b>   | Hardware Infrastructure Energy & Water Management  | (1) Total energy consumed, (2) percentage grid electricity and (3) percentage renewable   | Quantitative                                | Gigajoules (GJ), Percentage (%)                         | <span style="color: #6B8E23;">■</span>  |
|   |  | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative                                | Thousand cubic metres (m <sup>3</sup> ), Percentage (%) | <span style="color: #0070C0;">■</span>  |
|   |  | Discussion of the integration of environmental considerations into strategic planning for data centre needs   | Discussion and Analysis                     | n/a   | <span style="color: #0070C0;">■</span> <span style="color: #6B8E23;">■</span> |
|   | Product Packaging & Distribution   | Total greenhouse gas (GHG) footprint of product shipments   | Quantitative                                | Metric tonnes (t) CO <sub>2</sub> -e                    | <span style="color: #6B8E23;">■</span>  |
|   |  | Discussion of strategies to reduce the environmental impact of product delivery   | Discussion and Analysis                     | n/a   | <span style="color: #6B8E23;">■</span>  |
| <b>Household &amp; Personal Products</b>                                      | Water Management   | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative                                | Thousand cubic metres (m <sup>3</sup> ), Percentage (%) | <span style="color: #0070C0;">■</span>  |
|   |  | Description of water management risks and discussion of strategies and practices to mitigate those risks  | Discussion and Analysis                     | n/a   | <span style="color: #0070C0;">■</span> <span style="color: #6B8E23;">■</span> |
|   | Environmental & Social Impacts of Palm Oil Supply Chain  | Amount of palm oil sourced, percentage certified through the Roundtable on Sustainable Palm Oil (RSPO) supply chains as (a) Identity Preserved, (b) Segregated, (c) Mass Balance or (d) Book & Claim  | Quantitative                                | Metric tonnes (t), Percentage (%)                       | <span style="color: #0070C0;">■</span> <span style="color: #6B8E23;">■</span> |
| <b>Multiline and Specialty Retailers &amp; Distributors</b>                   | Energy Management in Retail & Distribution   | (1) Total energy consumed, (2) percentage grid electricity and (3) percentage renewable   | Quantitative                                | Gigajoules (GJ), Percentage (%)                         | <span style="color: #6B8E23;">■</span>  |

## EXTRACTIVES & MINERALS PROCESSING

|   |   |   |  |  |  |
|---|---|---|--|--|--|
| <b>Construction Materials</b>                       | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage covered under emissions-limiting regulations   | Quantitative   | Metric tonnes (t) CO <sub>2</sub> -e, Percentage (%)                       | ■                                      |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets  | Discussion and Analysis  | n/a  | ■                                      |
|   | Air Quality                               | Air emissions of the following pollutants: (1) NO <sub>x</sub> (excluding N <sub>2</sub> O), (2) SO <sub>x</sub> , (3) particulate matter (PM10), (4) dioxins/furans, (5) volatile organic compounds (VOCs), (6) polycyclic aromatic hydrocarbons (PAHs) and (7) heavy metals | Quantitative   | Metric tonnes (t)  | ■                                      |
|   | Energy Management                         | (1) Total energy consumed, (2) percentage grid electricity, (3) percentage alternative and (4) percentage renewable   | Quantitative   | Gigajoules (GJ), Percentage (%)  | ■ ■                                    |
|   | Water Management                          | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative   | Thousand cubic metres (m <sup>3</sup> ), Percentage (%)                    | ■                                      |
|   | Waste Management                          | Amount of waste generated, percentage hazardous and percentage recycled   | Quantitative   | Metric tonnes (t), Percentage (%)  | ■                                      |
|   |   | Product Innovation  | Percentage of products that qualify for credits in sustainable building design and construction certifications | Quantitative   | Percentage (%) by annual sales revenue |
| <b>Coal Operations</b>                              | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage covered under emissions-limiting regulations   | Quantitative   | Metric tonnes (t) CO <sub>2</sub> -e, Percentage (%)                       | ■                                      |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets  | Discussion and Analysis  | n/a  | ■                                      |
|   | Water Management                          | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative   | Thousand cubic metres (m <sup>3</sup> ), Percentage (%)                    | ■                                      |
|   |   | Number of incidents of non-compliance associated with water quality permits, standards and regulations  | Quantitative   | Number   | ■                                      |
|   | Reserves Valuation & Capital Expenditures | Sensitivity of coal reserve levels to future price projection scenarios that account for a price on carbon emissions  | Quantitative   | Million metric tonnes (Mt)   | ■ ■                                    |
|   |   | Estimated carbon dioxide emissions embedded in proven coal reserves   | Quantitative   | Metric tonnes (t) CO <sub>2</sub> -e                                       | ■ ■                                    |
|   |   | Discussion of how price and demand for coal or climate regulation influence the capital expenditure strategy for exploration, acquisition and development of assets   | Discussion and Analysis  | n/a  | ■ ■                                    |
| <b>Oil &amp; Gas – Exploration &amp; Production</b> | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage methane, percentage covered under emissions-limiting regulations   | Quantitative   | Metric tonnes CO <sub>2</sub> -e (t), Percentage (%)                       | ■                                      |
|   |   | Amount of gross global Scope 1 emissions from: (1) flared hydrocarbons, (2) other combustion, (3) process emissions, (4) other vented emissions and (5) fugitive emissions  | Quantitative   | Metric tonnes CO <sub>2</sub> -e   | ■                                      |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets  | Discussion and Analysis  | n/a  | ■                                      |
|   | Water Management                          | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative   | Thousand cubic metres (m <sup>3</sup> ), Percentage (%)                    | ■                                      |
|   |   | Volume of produced water and flowback generated; percentage (1) discharged, (2) injected, (3) recycled; hydrocarbon content in discharged water   | Quantitative   | Thousand cubic metres (m <sup>3</sup> ), Percentage (%), Metric tonnes (t) | ■                                      |

| INDUSTRY | DISCLOSURE TOPIC | METRIC | METRIC CATEGORY | METRIC UNIT OF MEASURE |  |

## EXTRACTIVES & MINERALS PROCESSING

|   |   |   |                         |   |     |
|---|---|---|-------------------------|---|-----|
| <b>Oil &amp; Gas – Exploration &amp; Production</b> | Water Management                          | Percentage of hydraulically fractured wells for which there is public disclosure of all fracturing fluid chemicals used   | Quantitative            | Percentage (%)  | ■   |
|   |   | Percentage of hydraulic fracturing sites where ground or surface water quality deteriorated compared to a baseline  | Quantitative            | Percentage (%)  | ■   |
|   | Reserves Valuation & Capital Expenditures | Sensitivity of hydrocarbon reserve levels to future price projection scenarios that account for a price on carbon emissions   | Quantitative            | Million barrels (MMbbls), Million standard cubic feet (MMscf) | ■ ■ |
|   |   | Estimated carbon dioxide emissions embedded in proved hydrocarbon reserves  | Quantitative            | Metric tonnes (t) CO <sub>2</sub> -e                          | ■ ■ |
|   |   | Amount invested in renewable energy, revenue generated by renewable energy sales  | Quantitative            | Presentation currency   | ■ ■ |
|   |   | Discussion of how price and demand for hydrocarbons or climate regulation influence the capital expenditure strategy for exploration, acquisition and development of assets | Discussion and Analysis | n/a   | ■ ■ |
| <b>Iron &amp; Steel Producers</b>                   | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage covered under emissions-limiting regulations   | Quantitative            | Metric tonnes (t) CO <sub>2</sub> -e, Percentage (%)          | ■   |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets          | Discussion and Analysis | n/a   | ■   |
|   | Energy Management                         | (1) Total energy consumed, (2) percentage grid electricity and (3) percentage renewable   | Quantitative            | Gigajoules (GJ), Percentage (%)                               | ■ ■ |
|   |   | (1) Total fuel consumed, (2) percentage coal, (3) percentage natural gas and (4) percentage renewable   | Quantitative            | Gigajoules (GJ), Percentage (%)                               | ■ ■ |
|   | Water Management                          | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative            | Thousand cubic metres (m <sup>3</sup> ), Percentage (%)       | ■   |
|   | Supply Chain Management                   | Discussion of the process for managing iron ore or coking coal sourcing risks arising from environmental and social issues  | Discussion and Analysis | n/a   | ■   |
| <b>Oil &amp; Gas – Midstream</b>                    | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage methane, percentage covered under emissions-limiting regulations   | Quantitative            | Metric tonnes (t) CO <sub>2</sub> -e, Percentage (%)          | ■   |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets          | Discussion and Analysis | n/a   | ■   |
| <b>Metals &amp; Mining</b>                          | Greenhouse Gas Emissions                  | Gross global Scope 1 emissions, percentage covered under emissions-limiting regulations   | Quantitative            | Metric tonnes (t) CO <sub>2</sub> -e, Percentage (%)          | ■   |
|   |   | Discussion of long- and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of performance against those targets          | Discussion and Analysis | n/a   | ■   |
|   | Energy Management                         | (1) Total energy consumed, (2) percentage grid electricity and (3) percentage renewable   | Quantitative            | Gigajoules (GJ), Percentage (%)                               | ■ ■ |
|   | Water Management                          | (1) Total water withdrawn, (2) total water consumed; percentage of each in regions with High or Extremely High Baseline Water Stress  | Quantitative            | Thousand cubic metres (m <sup>3</sup> ), Percentage (%)       | ■   |
|   |   | Number of incidents of non-compliance associated with water quality permits, standards and regulations  | Quantitative            | Number  | ■   |

## CONCLUSION

As the global investment community increasingly recognises that a company's ability to generate cash flows over the short, medium and long term is inextricably linked to its interactions with stakeholders, society, the economy and the natural environment, the movement to better understand and more effectively manage climate risk in investment portfolios continues to gain momentum. Sustainability factors are becoming mainstream to investment decision-making and how companies plan, manage and report.

Although climate risk is hardly new, global capital markets have had challenges addressing it effectively and efficiently, including a lack of comparability and confusion about the 'alphabet soup' of initiatives. The International Sustainability Standards Board (ISSB) of the IFRS Foundation was established in response to strong demand for high quality, globally comparable information on how sustainability-related risks and opportunities—including climate—affect a company's prospects.

In June 2023, the ISSB published its first two Standards, IFRS S1 *General Requirements for Disclosure of Sustainability-related Financial Information* and IFRS S2 *Climate-related Disclosures*. The ISSB developed IFRS S1 and IFRS S2 with the benefit of extensive market feedback and international support from the G7, G20, International Organization of Securities Commissions (IOSCO), Financial Stability Board, African Finance Ministers and Finance Ministers and Central Bank Governors from more than 40 jurisdictions. The ISSB Standards consolidate and build upon the resources of the SASB, IIRC, CDSB and TCFD. They are assurable and enforceable, designed to elicit decision-useful information connected to financial statements.

The ISSB's delivery of IFRS S2 provides the capital markets with a truly global baseline of climate-related disclosures and a common language for disclosing the effects of climate-related risks and opportunities on a company's prospects.

The scope of IFRS S2 covers (a) climate-related risks to which a company is exposed, including climate-related physical risks and climate-related transition risks and (b) climate-related opportunities available to the company. To help companies identify and prepare disclosures on the climate-related risks and opportunities most likely to affect their prospects, the ISSB has provided Industry-based Guidance on Implementing IFRS S2, which addresses climate-related risks and opportunities associated with particular business models, activities or other common features that characterise participation in an industry. This Guidance is based on and aligned with the SASB Standards.

As the market's understanding of climate risk continues to evolve, companies, investors, regulators and policymakers will adapt, taking new approaches to understand and mitigate risks and capitalise on opportunities. While these developments unfold, the SASB Standards will evolve alongside them.

The ISSB has committed to maintain and enhance the SASB Standards and encourages preparers and investors to continue to use them.

With the increasingly sophisticated tools and information that have begun to emerge, addressing climate risk in capital markets can no longer be viewed as a zero-sum game. A healthy climate and a healthy global economy can and should be mutually supportive—not an exercise in maximising today's financial returns at the expense of tomorrow's. By pushing for more effective and efficient pricing of climate risks across the financial system, investors have the opportunity to create sustainable, long-term value for themselves and their portfolio companies, while building a more resilient economy for the world at large.
